

AI BADGE

Victor del Rosal

Thinking Partner

Most people use AI as a search box.

Practitioners use it as a thinking partner.

SEARCH BOX

One question. One answer. You take it or leave it.

THINKING PARTNER

A conversation that builds a calibrated, evidence-based view you could not have reached alone.

Seven moves turn any vague question into a view you can act on.

One real question, worked end to end.

Not a toy prompt. A question with real stakes pulls a better answer out of the model.

FORGETTABLE

"Tell me about software jobs."

REAL STAKES

"Set the record straight about software jobs. There is a lot of talk about redundancies and about more work than ever. What is a genuinely useful way to think about it?"

Seven moves. Three of them change everything.

The three marked with a key are the moves almost no one thinks to make.

1

Ask a real question

Real stakes pull better answers.

2

Drill deeper

Push for evidence, then the time horizon.

3

KEY Ask the AI for the questions

It surfaces the angles you missed.

4

KEY Surface the hypotheses

Make the model's reasoning explicit.

5

KEY Force calibration

Confidence and assumptions, per claim.

6

Compress to a reusable prompt

Then cross-validate elsewhere.

7

The retrospective

What should I have asked from the start?

Turn the AI from answerer to question-designer.

The single biggest unlock. The questions you did not know to ask are usually the valuable ones.

THE PROMPT

"If you could ask any questions and explore every angle of this, what would you be most curious to ask?"

Why it works

You stop limiting the conversation to your own framing. The model maps the territory you cannot see yet.

What comes back

- Which roles actually shrink, and which just change shape?
- What does the data say versus the headlines?
- How fast is the shift, in years not decades?
- What skills compound, and what becomes a commodity?
- Where does judgement still beat automation?

Most people would never have thought of half of these.

Make the reasoning visible. Then make it honest.

SURFACE THE HYPOTHESES

"What working theories or hypotheses are we entertaining here?"

Now you see the structure of the answer, not just the answer.
You can test each theory on its own.

Example theories surfaced:

- Demand for software rises as it gets cheaper to build.
- Routine coding commoditises; system judgement does not.

FORCE CALIBRATION

"State your confidence on each claim, and name the assumptions behind it."

This is bet-weights in chat form. The model splits what it is sure of from what it is guessing.

HIGH Software demand grows long-term.

MEDIUM Mid-level roles compress first.

LOW Exact timing of the shift.

The most underrated prompt in AI.

"What prompt should I have used from the very start, and what would have been the most useful questions to ask?"

Why it is the punchline

- **It compresses the whole conversation**
- **It teaches you, not just answers you**
- **It is reusable**

The model hands back the single master question that would have unlocked it in one move.

Run it after any hard conversation and your next first prompt gets sharper.

Save the master question. It becomes the opening move next time you face the topic.

You stop being a user.

You become a collaborator.

- **Today** Take one real question you are sitting with and run all seven moves.
- **This week** Use the three key moves on demand: ask-for-questions, hypotheses, calibration.
- **Next month** End every hard chat with the retrospective. Keep the master questions.
- **Beyond** Carry this into every other lesson. It changes how you use all of them.

Keep the seven-moves card beside you. AI is a thinking partner if you let it design the questions.
